	1 piece	Sunflower Seedling
	1 piece	Plant Tag
SUPPLEMENTARY ITEMS (SELF PROVIDE)		
	1 jug	Water <i>for watering plant</i>
	1 piece	Plastic Spoon <i>for scooping potting mix and transplanting</i>
	1 piece	Marker Pen <i>for labeling plant tag</i>

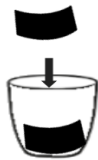

INSTRUCTIONS

Learning Objectives:

Transplanting sunflower seedling into a new pot.

Witness transplant shock, and learn to care for sunflower seedling.

STEP 1:
Place felt fabric at the base of the pot.

STEP 2:
Add a bag of potting mix into the pot.

STEP 3:
Sprinkle a little insect frass over the potting mix into the pot.

STEP 4:
Transplant seedling into the pot.

STEP 5:
Add the other bag of potting mix into the pot. Adjust the potting mix to keep the seedling in place.

STEP 6:
Sprinkle a little insect frass over the potting mix into the pot. Keep the remaining insect frass for weekly fertilizing.

STEP 7:
Water the pot thoroughly until water seeps through from the bottom of the pot. This will help the seedling recover from transparent shock (wilting effect)

STEP 8:
Place in an area with >6hrs of direct light. Water seedling every day. Add a small amount of insect frass weekly. Transplant sunflower seedling to a bigger pot or garden once it out grows the current pot.

SUPPLEMENTARY DETAILS

1. Plant Care:

- a. Take care when transplanting, sunflower roots are delicate. Water thoroughly after transplanting for seedling to recover.
- b. Sunflowers take up to 120 days to grow.
- c. Water and fertilize regularly and make sure the medium is well drained.
- d. Sunflowers' roots develop rapidly and form mass, ensuring the plant is transplanted to prevent root bound.

2. System Care:

- a. Wash the pot thoroughly after the sunflower is transplanted out.
- b. The pot is durable and can be used to germinate or used as a container for other plants or relevant size.

3. Excess Material Storage:

- a. Store excess insect frass in cool, dark and dry locations. Keep out of reach from toddlers and young children.
